

Tank Fabrication

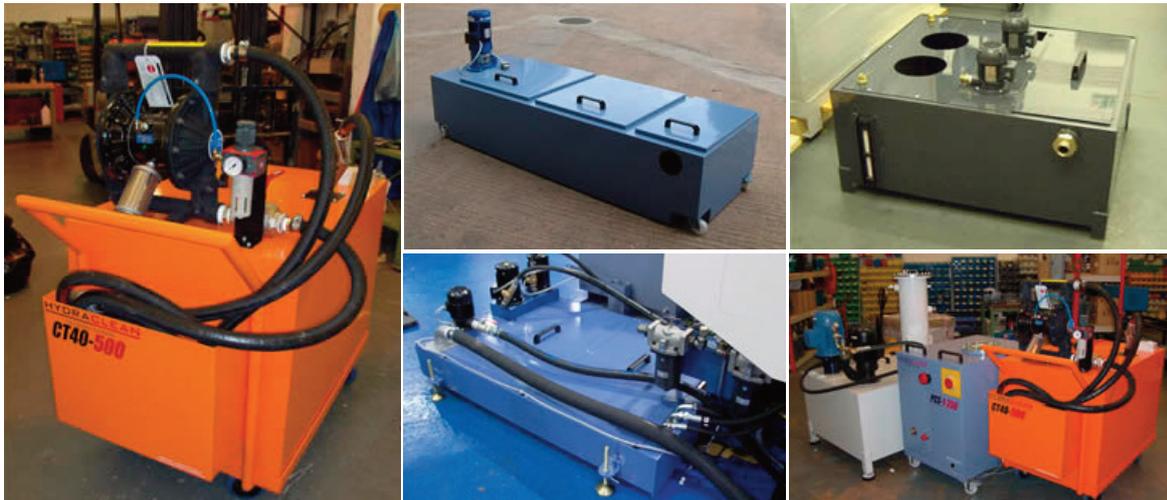

Overview

Pumps and Equipment have the ability to design and manufacture a wide range of specialist tanks to meet your needs. Working in AutoCad and SolidWorks we can incorporate our designs to match your existing machine drawings.

Fabrication work is aided by the use of computer-aided laser cutting machines, giving repeatability, accuracy, and overall finish to meet the most exacting of requirements. The Quality of our products is enhanced by powder-coated and 2-pack epoxy paint finishes, which we standardise on. All fabrications are finished to the customer's paint colour requirements, provided we are given the appropriate RAL or BS code.

All fabrications leave our workshop with the required pumps, associated fittings, and electrical panel(s) as required. The system is electrically wired for 'plug and play'.

As part of a turnkey package, we can further install and commission this equipment at your site, using our own skilled labour.
