

Wash Guns

Overview

The wash gun is an accessory which can be fitted to most CNC machine tools. The Pumps and Equipment option comes as a complete retro-fit kit, which includes all all electrical and mechanical parts required for the installation. The unit can be supplied on its own, or fitted by our expert engineers upon request. The design is fully automatic and operates when the gun is removed from the holster, thereby energising the delivery pump. Upon depression of the trigger, coolant is discharged (see Fig. 2). The holster is typically located close to the machine door (Fig. 3) and in easy reach for the operator. With most paint colours available, the gun holster and pump plate modifications are able to complement any CNC machine tool. Pump Plate modifications are available upon request but are not part of the standard kit.

Delivery pump mounted in coolant tank
